

Discrete Structures: CMPSC 102

Oliver BONHAM-CARTER

Fall 2022
Week 10

Key Questions

How do I use **dynamically generated streams** of data to implement **memory efficient** and **predictable** Python programs?

Learning Objectives

To **remember** and **understand** some the concept of a **monoid**, seeing how it connects to **practical applications** with strings and sequences

Static versus Dynamic

Discrete
Structures:
CMPSC 102

CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

In Chapter 7.1, Staveland Says ...

An input stream, for example, appears to a program to be a sequence of values - lines, characters, numbers from sensors, whatever they may be - that are not present all at once, but appear dynamically over time. Some input streams don't even have an end: the data keeps coming indefinitely.

Simple Definitions

- Static sequences exist as a **complete structure**
- Dynamic sequences are **generated incrementally**
- Dynamically generated sequences are **streams**

Streams: Static variables

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

What is "Static"?

- **Static:** Does not change. **Dynamic** is able to change.
- A *static* data structure is an organized container or collection of data in memory of a fixed size
- A "static" sequence may be mutable like a list but at any one time, it exists as a complete data structure.
- **Static** lists and **Active** lists

Static list

```
stringList = ['count_'+str(i+1) for i in range(4)]
```

Active list

```
a = 2; b = 3  
myList_list = [a+b, b+a, len(["a","b"])]
```

Some Static Lists

Static sequence exists as a complete structure

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

```
listOfWords = ["this","is","a","list","of","words"]
items = [ word[0] for word in listOfWords ]
print(items) # first chars of each word
# ['t', 'i', 'a', 'l', 'o', 'w']
```

```
print([x+y for x in 'tea' for y in 'pot'])
# ['tp', 'tt', 'ep', ..., 'at']
```

```
print([x+y for x in 'tea' for y in 'pot' if x != 't' and y != 'o' ])
# ['ep', 'et', 'ap', 'at']
```

```
print ([x+y for x in 'tea' for y in 'pot' if x != 't' or y != 'o' ])
# ['tp', 'tt', 'ep', ..., 'at']
```

```
zeros_list=[0]*5
print(zeros_list)
```

```
item_list=['item']*3
print(item_list) #['item', 'item', 'item']
```

File Input Involves the Use of Streams

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

```
file = open("emails")
for line in file:
    name, email = line.split(",")
    if name == "John Davis":
        print(email)
```

- The **file** is a **sequence** of characters
- A **character** is a sequence of **numbers**
- Does the entire **file exist** in the computer's memory?
- What would happen if the file was **many gigabytes** in size?
- Are there **alternatives** for static sequences? **What are they?**

Using Comprehensions and Generators

Dynamic sequence is generated incrementally

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

Generator Function

```
even_squares = (x * x for x in range(10)
                 if x % 2 == 0)

print(even_squares)
#<generator object <genexpr> at 0x370d878>

for value in even_squares:
    print(value)
```

Output

```
0 4 16 36 64
```

Using Comprehensions and Generators

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

```
# Note: square brackets
list_comprehension = ['Hello' for i in range(3)]
print(list_comprehension)
```

```
# Note: curly brackets
generator_expression = ('Hello' for i in range(3))
print(generator_expression)
```

Output: square brackets

```
['Hello', 'Hello', 'Hello']
```

Output: curly brackets

```
<generator object <genexpr> at 0x2c34cc8>
```

Generator Functions

"Data when you need it!"

Discrete
Structures:
CMPSC 102

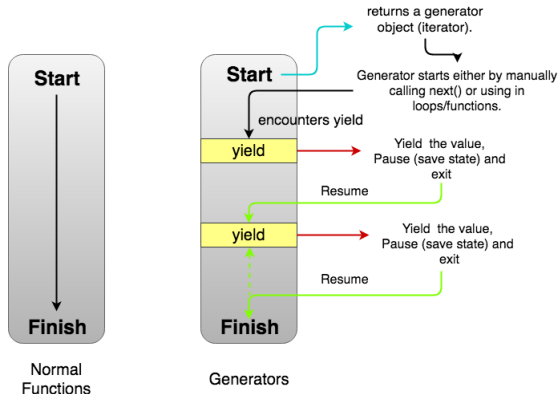

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

- Generators are convenient way of creating iterators.
- They are functions returning objects (iterators) for iteration of one value at a time.

Process List Items When Needed

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

Another Stream Invoking an iterator

```
l_list = ["Apples", "Oranges", "Apricots",  
"Avocado", "Ananas (pineapple)", "Asparagus"]
```

```
names = (line[:] for line in l_list) # create a generator  
print(names) # generator function, no data added just yet  
type(names) # <class 'generator'>
```

```
for i in names: print("\t First round :", i)  
print("\t Let's try that again! ")
```

```
for i in names: print("\t Second round :", i) #... ?
```

- The generator expression is evaluated, creating an iterator, and the *name* variable is bound to that iterator.
- The for-statement invokes names for values one after the next
- The name generator is then destroyed

The Yield function

File: createGen.py

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

Create another generator

```
def createGenerator():  
    mylist = range(3)  
    for i in mylist:  
        # find the square of the value as needed  
        yield i*i  
# end of createGenerator()  
  
# Initiation: create a generator  
myGenerator = createGenerator()  
# Where is this generator in memory?  
print(myGenerator)  
for i in myGenerator:  
    print("\t A: myGenerator: ",i)  
  
for i in myGenerator:  
    print("\t B: myGenerator: ",i)
```

Oliver
BONHAM-
CARTER

- $F_n = F_{n-1} + F_{n-2}$
- For $n = 1, 2, \dots, 8$
- The sequence follows as: 1, 1, 2, 3, 5, 8, 13, 21

Interesting reference:

Calculate by a Generator Functions

Generator function: Return elements as necessary with yield

Make a tuple containing the results

```
def fibonacci_generator(n):  
    a = 1; b = 1  
    for i in range(n):  
        yield a  
        a, b = b, a + b # increment a and b  
  
print(fibonacci_generator)  
  
for value in fibonacci_generator(10):  
    print(value, end=" ")
```

- Generator function yields results when they are called.

Binet's Formula: Static Function

Similar to a Generator: Return elements as needed

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

Binet's Formula

$$F_n = \frac{1}{\sqrt{5}} \left(\left(\frac{1+\sqrt{5}}{2} \right)^n - \left(\frac{1-\sqrt{5}}{2} \right)^n \right)$$

- Static equation using Binet's formula

A static function for the Fibonacci sequence

```
import math
def fibsBinet(n):
    a = (1/math.sqrt(5))
    b = ((1 + math.sqrt(5))/2)**n
    c = ((1 - math.sqrt(5))/2)**n
    return a * (b - c)
#end of fibsBinet()
for i in range(8): # calculate each value as needed
    print(int(fibsBinet(i)))
```

Calculate by Tuple-Maker Function

Not a Generator: Return elements of the sequence all at once in a structure

Make a tuple containing the results

```
def fibsTuple(n):  
    result = ( )  
    a=1  
    b=1  
    for i in range(n):  
        result += (a,)   
        a, b = b, a + b  
    return result  
print("  My type is: ",type(fibsTuple))  
print(fibsTuple(5)) #(1, 1, 2, 3, 5)
```

- Every time around the loop, the function creates a new tuple, a copy of result with another value concatenated onto the end. Each tuple but the last is never used again.
- Result is returned in one structure

List-Maker Functions For Fibonacci Sequences

Not a Generator: Return elements of the sequence all at once in a structure

Discrete
Structures:
CMPSC 102

Oliver
BONHAM-
CARTER

Let's Discuss

Static and
Dynamic
Sequences

Yield function

List Generator
Generator with
Yield

A list maker

```
def fibsList(n):  
    # produce a list  
    result = [ ]  
    a=1; b=1  
    for i in range(n):  
        result.append(a)  
        a, b = b, a + b  
    return result  
  
print(" My type is: ",type(fibsList))  
print(fibsList(4)) #[1, 1, 2, 3]
```

- More efficient function than `fibsTuple()`: as a result is modified in place rather than creating a whole new data structure during each iteration
- When n is large the difference may be significant
- Result is returned in one data structure

Generator Functions For Fibonacci Sequences

Creating sequences dynamically with *yield*

- Functions having *yield*-statement are generator
- This function works as a generator or otherwise

A generator function for the Fibonacci sequence

```
def fibs(n):  
    a=1  
    b=1  
    for i in range(n):  
        yield a  
        a, b = b, a + b  
print([x for x in fibs(6)])  
print(" My type is:",type(fibs))  
f = fibs(6)  
for i in f: print(i)  
print(" My type is: ",type(fibs(6)))
```
